

247connect boosts IT team efficiency with unlimited concurrent connections at no extra cost

Businesses that need to solve IT issues quickly and securely can now do so at an even lower cost, with unlimited remote connections that include 5 concurrent sessions per user included in every 247connect plan.

The feature, which is included as standard as part of any 247connect pack, means every user can log in and maintain multiple live sessions at once, without restrictions or additional fees. Each user can connect to up to five devices at the same time, allowing IT teams to respond to more support requests efficiently, whether they are assisting internal users or external customers.

Designed for simplicity and efficiency

247connect is designed to help IT teams manage remote support quickly and securely, without unnecessary complexity. Its straightforward installation process and intuitive interface enable teams to get started with minimal training, while its focused feature set supports essential remote management tasks without overloading users.

PC Pro's latest review said:

"It offers a strong alternative to the established names. Its pricing plans are good value, it's easy to use, and its zero-trust foundation delivers extra-tight controls."

Tom Murray, product manager at 247connect, said:

"We set out to remove the usual roadblocks: complicated installs, confusing interfaces and surprise charges. With 247connect, you get a simple setup, a user-friendly dashboard and a fixed low price. Crucially, unlimited concurrent connections are built in, so every user can be logged in and working at the same time – with each then having up to five concurrent sessions. No add-ons, no per-session fees."

Clear pricing, no surprises

Transparency is baked in. Install 247connect on all your devices and only pay to support the ones you need at any time. There are no extra charges to unlock features, no caps on how many users can be logged in and no per-connection fees.

Security at its heart

Backed by over 30 years of remote support expertise, 247connect includes robust safeguards such as Zero Trust Network Access (ZTNA), two-factor authentication and 256-bit AES encryption, so every remote session stays protected.
